

Changing Nature of State and Life; The New Ecosystem

When having looked at the basic trends, the global competition has been developing over “micro-nationalism”, “integration” and “unpredictability” in the new economy age based on the “knowledge and knowledge-based products” following the “earth and machine”; and the challenges determining the new nature of life and state are being formed as basic references as “source and sharing crisis”, unsustainability of the “production-consumption-development” formula, “elimination of middle class” with Chinese leverage, “energy, water and food insecurity”, going to the ‘4th Dimension’ in every field of life, “elimination of human source in labor”, “transforming to soft power from hard power” based on the changing nature of state and expectation management.

Within all of these basic parameters; the transformations in technology tends to change human life and nature entirely by developing, based on artificial intelligence, virtual/refined reality and mobility. It is obvious that “Industry 4.0” and “Society 5.0” concepts are important titles in terms of managing the transformation of the world.

Another factor is the turbulence that China created by getting effective in the world stage with each passing day. The New Silk Road project “Belt and Road” has been shaping as the global integration project involving 64 countries both from sea and land, and changing the distribution of the financial pie permanently.

Along with all of these developments, "Ecosystem of Security" changes with its law. After now on, Security - Democracy dilemma will be witnessed much more. Because the survival of democracy is very difficult in countries where the middle class melts and security axis slides on a sophisticated level. The question "Will security bring us authoritarian regimes?" should be discussed more. It also should be seen that authoritarian regimes or chaos lie as two alternatives in the countries which lack middle class.

How to make the division of labor in terms of regional and global security and how to share the cost are in line for to be issues of the coming period. The development of new security alliances can be analyzed from the risks and initiatives of various countries, especially Turkey.

The content of the concepts “property” and “power” has been changing historically. The future of the EU within the syndrome of “Failure in Success” will be determined by the results of polarization which is revived in the West after Brexit and similar to pre-World War II.

New weapons declaration of Russia, one of the new global power candidates, and gold guaranteed yuan and oil trading of China have been a milestone for the security ecosystem and reserve money, by the way, the meaning of Brexit on its effect on the balances has been a little further behind.
